

ABSTRACT OF THE DISCLOSURE

Disclosed is a broadcasting program reservation-recording system using a PDA comprising: a CDMA module provided with a mobile communication module
5 for receiving broadcasting program information; a remote communication controller for exchanging data with an external device or performing a wireless communication in order to control the external device; a storage unit for storing broadcasting program information received through the CDMA module and control data for each kind of external device received by the remote communication
10 controller; a controller for converting the broadcasting program information stored in the storage unit into data information of a suitable form to be displayed and thereby outputting; and a display unit for displaying data information regarding the broadcasting program information outputted from the controller on a screen. According to the system, broadcasting program information such as EPG
15 information can be reservation-recorded by simply certifying on the screen of the PDA even under a state that powers of a broadcasting receiver and a TV are turned off, thereby reducing a power consumption for performing a reservation-recording. Also, broadcasting programs can be reservation-recorded conveniently at a distant place.
